01

WHAT RMS IS

Product Overview & Unique Selling Proposition

RMS is a multi-tenant retail management platform that runs a retailer's entire operation — head office and every store beneath it — alongside a connected marketplace of approved vendors, in one system.

Where most retail software picks a lane — a POS, an inventory tracker, a vendor portal — RMS treats them as one connected operation. A head-office admin, a store cashier, and a supplier's sales team all work inside the same system, each seeing only the slice that's theirs: departments, permissions, and store scope are enforced at the account level, not left to convention.

UNIQUE SELLING PROPOSITION

RMS is the only layer where **retailer operations and vendor relationships are the same system**, not two products stitched together — purchase orders, goods receipt, catalogue, and fulfillment history all live in one place, so a retailer's vendor ranking is built from their own real order history, not a generic star rating.

MODULAR BY DESIGN

Department-based access

HR, Finance, Inventory, Cashier, Logistics, Design & Pattern, Forecast & Analytics, and more — enabled per plan, assigned per admin.

APPROVAL-GATED

Vendor relationships

No open marketplace scraping. A vendor is only purchasable from once a retailer has explicitly approved the relationship.

TRANSPARENT, NOT BLACK-BOX

Forecasting & ranking

Demand forecasts and vendor scores are computed from a retailer's own sales and order history with a disclosed, auditable method.

SCALES DOWN AS WELL AS UP

Single-store to multi-tenant

A single shop and a multi-store, multi-department retail chain run on the same platform, at the plan tier that fits.

Product Objectives

- **Centralize retail operations.** Bring inventory, point-of-sale, purchasing, HR, and finance under one account instead of disconnected spreadsheets and single-purpose tools.
- **Make vendor relationships accountable.** Replace informal WhatsApp-and-phone-call purchasing with tracked purchase orders, goods receipt, and a vendor ranking grounded in a retailer's own fulfillment history.
- **Reduce purchasing guesswork.** Turn a retailer's own sales history into a demand forecast and a budget-constrained purchase plan, so "what to buy, from whom, and how much" has a defensible starting answer.
- **Give vendors a self-service portal.** Let suppliers manage their catalogue, respond to orders, and communicate directly, cutting the manual coordination that usually falls on the retailer's buying team.
- **Support growth without a platform switch.** A retailer can start as a single store and grow into a multi-store, multi-department operation without migrating to different software.
- **Keep operations accountable.** Role-based access, department scoping, and a tiered support-escalation path (store → HQ → Super Admin) so responsibility for any action is traceable.

03

WHO IT'S BUILT FOR

Target Audience

PRIMARY

Independent & multi-store retailers

Apparel and general retail businesses in India, from a single storefront to a head-office-managed chain of stores. GST- and HSN-aware by default.

PRIMARY

Vendors & suppliers

Manufacturers, wholesalers, and brands who supply retailers and want a direct channel for catalogue, orders, and payment tracking.

SECONDARY**Department & store staff**

Cashiers, inventory staff, HR, finance, logistics, and merchandising teams working inside a retailer's account day to day.

PLATFORM OPERATOR**Yarrowtech's own team**

The Super Admin layer that onboards tenants, approves vendor relationships, manages billing, and runs platform-wide support.

04**OWNERSHIP & OPERATION****Relationship with Yarrowtech**

RMS is a Yarrowtech product — designed, built, and operated by Yarrowtech, and listed among its offerings on the corporate website.

Yarrowtech is not a passive vendor of software; it operates the platform's control layer. Every retailer and vendor account on RMS exists inside infrastructure that Yarrowtech's own Super Admin role oversees: tenant onboarding review, plan and billing management, subscription enforcement, and the top tier of the support-escalation path all sit with Yarrowtech, not with any individual retailer.

In practical terms, this means:

- Retailer and vendor onboarding requests are reviewed and approved by Yarrowtech before an account becomes active.
- Platform-wide changes — pricing tiers, department availability, feature rollout — are Yarrowtech decisions, communicated to tenants rather than configured by them.
- When a support ticket is escalated past a retailer's own HQ Admin, it is Yarrowtech's support inbox that receives and resolves it.
- Data processed through RMS is hosted and governed under Yarrowtech's infrastructure and data-handling policies.

05

WHO CAN DO WHAT

User Roles

Access in RMS is layered: a **scope** (platform, HQ, or store), a **department** (HR, Finance, Inventory, and so on), and a set of **permissions** within it. Every role below is a combination of those three, not a fixed label.

ROLE	SCOPE	WHAT THEY CAN DO
Super Admin Yarrowtech	Platform-wide	Approves onboarding, manages billing and subscriptions, suspends or reactivates tenants, resolves escalated support tickets across every retailer and vendor.
Retailer HQ Admin	Head office	Manages the whole retailer account: stores, department admins, integrations, billing, and every ticket raised anywhere in the business.
Department Admin	HQ, one department	Runs a single central function — HR, Finance, Inventory, Forecast & Analytics, and others — across the whole retailer, not tied to one store.
Store Admin / Store staff	One store	Manages operations for a single store — inventory, POS, or a department scoped to that location — and sees other staff at that same store.
Cashier	One store	Runs point-of-sale billing and returns at their store; the most tightly scoped role in the retailer hierarchy.
Vendor	Own business	Manages their catalogue, responds to purchase orders, tracks fulfillment and payments, and communicates with retailers they have an approved relationship with.

06

HOW MONEY MOVES

Payment Services

All payment processing in RMS runs through **Razorpay**, a licensed third-party payment gateway. RMS never collects or stores card, UPI, or bank details directly.

- **Retailer onboarding.** A new retailer completes their plan payment on a Razorpay-hosted checkout page; the tenant account activates only once Razorpay confirms payment.
- **Store & plan upgrades.** Adding stores or moving to a higher plan tier is billed and processed the same way.
- **Vendor subscriptions.** Vendor marketplace visibility and catalogue limits are tiered, paid subscriptions, renewed and receipted through the same gateway.

WHAT RMS DOES AND DOESN'T HOLD

RMS stores payment *outcomes* — order IDs, subscription status, receipts, expiry dates — never raw payment instrument data. Card and bank details are handled entirely within Razorpay's own PCI-compliant systems.

07

WHAT'S HELD, AND WHY

Data Collected

Every category of data RMS collects exists to run a specific part of the platform. None of it is collected speculatively.

DATA	PURPOSE	REASON FOR COLLECTING
Business details Name, GST, address, plan tier	Tenant identification and invoicing	Required to create and legally bill a retailer or vendor account.
Staff identity Name, email, phone, department	Account access and role assignment	Determines what a given login can see and do within the account.

DATA	PURPOSE	REASON FOR COLLECTING
Vendor profile Catalogue, business type, pricing	Vendor discovery and relationship management	Lets retailers evaluate and approve vendors, and drives vendor ranking from real terms.
Transaction records Sales, purchase orders, goods receipt	Core business operations	The operational record inventory, finance, and forecasting are all computed from.
Payment outcomes Order IDs, receipts, subscription status	Billing and access control	Confirms paid access without RMS ever holding raw payment instrument data.
WhatsApp contact details	Order and support notifications	Enables direct, faster communication for order updates where a user has opted into it.
Usage & audit logs Login activity, key actions	Security and accountability	Supports suspicious-activity detection and gives a factual record if an action is disputed.
Support ticket content	Issue resolution	Needed to diagnose and resolve the problem the ticket was raised for.

08

WHAT YARROWTECH COMMITS TO

Platform Responsibilities

- **Availability.** Operate and maintain the RMS infrastructure with reasonable uptime, and communicate planned downtime in advance.
- **Access security.** Enforce authentication, role-based permissions, and store/department scoping so a user only ever sees data their role is authorized for.
- **Data stewardship.** Maintain reasonable backups and safeguards for tenant data, and not access a tenant's business data except for support or maintenance purposes.

- **Support.** Provide a working, tiered support path — vendor and retailer tickets that reach the right level, up to Yarrowtech's own Super Admin inbox when escalated.
- **Payment integrity.** Route all payments through a compliant gateway (Razorpay) and never require card, UPI, or bank details by any other channel.
- **Transparency on change.** Communicate material changes to pricing, features, or department availability to affected tenants.

09

WHAT EVERY ACCOUNT HOLDER COMMITS TO

User Responsibilities

- **Accurate onboarding information.** Provide true business and identity details when creating an account.
- **Credential security.** Keep login credentials confidential and report suspected unauthorized access immediately.
- **Lawful use.** Use RMS only for genuine retail or vendor business activity, within applicable law.
- **Data accuracy.** Enter correct pricing, stock, tax, and vendor information — RMS reflects what a user records; it does not independently verify business facts.
- **Regulatory compliance.** Meet applicable tax and regulatory obligations (such as GST filing); RMS is a record-keeping and operations tool, not a substitute for compliance.
- **Respecting access boundaries.** Not attempt to access data or accounts outside a user's assigned role, store, or tenant.
- **Timely payment.** Keep subscription and plan payments current to maintain uninterrupted access.

10

WHERE RESPONSIBILITY ENDS

Limitations of Responsibility

READ BEFORE RELYING ON SYSTEM OUTPUT

Forecasts, vendor rankings, and purchase-plan suggestions are decision-support, computed from a tenant's own historical data — not guarantees. The final purchasing, pricing, and staffing decisions remain the retailer's.

• Not Yarrowtech's responsibility

- **Business outcomes.** Losses arising from decisions made using RMS's forecasts, rankings, or recommendations.
- **User-entered data accuracy.** Incorrect pricing, stock counts, GST, or vendor details entered by a tenant's own users.
- **Third-party service outages.** Interruptions caused by Razorpay, WhatsApp Business API, SMTP providers, or other external services RMS depends on.
- **Inter-business disputes.** Disagreements between a retailer and a vendor over an order, price, or delivery — RMS facilitates the transaction record; it is not a party to it.
- **Indirect or consequential loss.** Lost profits, business interruption, or

• Provided on an "as-is" basis

- RMS is provided without warranty of uninterrupted or error-free operation.
- Features under active development (forecasting methods, automation) are disclosed for what they are — for example, demand forecasts are a transparent moving-average calculation, not a guarantee of future sales.
- Where a data source genuinely doesn't exist yet — such as in-store footfall — the platform says so rather than fabricating a figure.
- Statutory or tax compliance (GST filing, invoicing law) remains the retailer's legal responsibility, not Yarrowtech's.

reputational harm beyond direct
platform fault.
